

# Piston Aviation Fuels Initiative (PAFI)

## Stakeholders Workshop

Presented by: Dave Atwood and Monica Merritt

March 18, 2014

Federal Aviation  
Administration

# Objective

- Coordinating Research Council
- Unleaded Avgas Transition Aviation Rulemaking Committee, (UAT ARC)
  - Issues
  - Recommendations & Key Accomplishments
- Why Replacement Fuels for General Aviation
- Piston Aviation Fuels Initiative, (PAFI)
- Piston Aviation Fuels Initiative Steering Group (PSG)
- Screening Information Request (SIR), Candidate Fuels, and Tech Center Testing
- Canada and US Collaboration
- Fleet Wide Certification

# Coordinating Research Council

- The purpose of the CRCAGC research was not to formulate a commercial blend but to conduct research available to industry as a means of facilitating industry evaluation of unleaded avgas alternatives.
- Two working groups were formed:
  - Unleaded Aviation Gasoline Development Group (UADG)
    - Goal: 100% Transparency
      - Replacing 100 low-lead (100LL) “gold standard” aviation gasoline
    - Full-scale engine evaluation of potential unleaded components
  - Octane Rating Group (ORG)
    - Goal: Determine fleet octane requirement for unleaded fuels
    - Legacy fleet designed, tested and certified on available leaded fuel

# Coordinating Research Council Research (UADG)

- Focus on motor octane (MON)
  - Developed matrix of high-octane potential blend components such as: renewables (ethanol), aromatic hydrocarbons (*tert*-Butylbenzene, toluene), oxygenates (ETBE), aromatic amines (*meta*-Toluidine), alkylates (super, aviation, motor), manganese based additive (MMT)
    - Created 202 high-octane unleaded fuel formulations for full ASTM D-910 aviation gasoline specification laboratory analyses (funded by FAA TC)
    - Analytical modeling and statistical analysis of laboratory test results used to select 30 blends for FAA TC full-scale engine detonation testing (50 gallons each)
      - Determine MON vs. full-scale engine performance and blend composition
      - Compare MON unleaded to leaded fuel performance
      - “Full-Scale Engine Knock Tests of 30 Unleaded, High-Octane Blends”, DOT/FAA/AR-04/25
    - Results from first 30 blends were used to create 47 new blends for FAA TC full-scale engine detonation testing (e.g. eliminated ethanol, mmt)
      - “Full-Scale Engine Detonation Tests of 47 Unleaded, High-Octane Blends”, DOT/FAA/AR-08/40

# Coordinating Research Council Research

- **Significant findings from FAA TC tests of 77 unleaded matrix fuels**
  - Unleaded blends required > 2 MON more to perform equal to the 100LL leaded aviation gasoline engine performance
  - For an unleaded blend to perform as well as the 100LL required 10% v/v aromatic amine, regardless of the MON, or other composition
    - Oxygenates, alcohols, toluene, and super alkylates would not get you there
    - Use of amines —specialty chemical, potential toxicity issues
    - No blend with MON equal to or less than the 100LL performed as well as the 100LL —significant safety issue
    - Results spurred further research comparing leaded and unleaded fuels
  - Two engines were tested using high and mid-octane fuels of same MON and supercharge rich rating made from typical aviation gasoline components
    - “High-Octane and Mid-Octane Detonation Performance of Leaded and Unleaded Fuels in Naturally Aspirated, Piston, Spark Ignition Aircraft Engines”, DOT/FAA/AR-TN07/5
      - Mid-octane unleaded aviation fuels required 2 to 3 more MON to perform equal to leaded aviation fuels in full-scale engine
      - High-octane unleaded aviation fuels required 4 more MON to perform equal to leaded aviation fuels in full-scale engine

# Coordinating Research Council Research

- **ASTM International Avgas Specification D 910 Task Force**
  - Engine data showed significant differences between leaded and unleaded fuels of the same octane
  - Task force recommended creating new unleaded aviation gasoline specifications
    - Mis-fueling was a stated safety concern
  - “High-Octane and Mid-Octane Detonation Performance of Leaded and Unleaded Fuels in Naturally Aspirated, Piston, Spark Ignition Aircraft Engines”, FR AR-TN07/5

# Coordinating Research Council Research

## Coordinating Research Council FAA TC Very-Low Lead Fuels Full-Scale Engine Testing

- Near term 20% reduction in current leaded avgas
- 2017 EPA date for state compliance with 90% reduced Pb NAAQS standard
- Used “worst-case” naturally aspirated engine
- Multiple fuels of varying Pb levels, production fuel base alkylate
- FAA TC fuel survey

## CRC Research Report, Oct. 2010

CRC Report No. 657

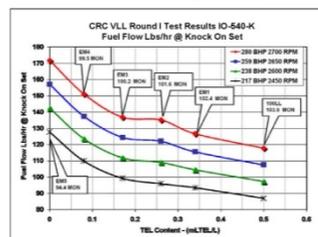

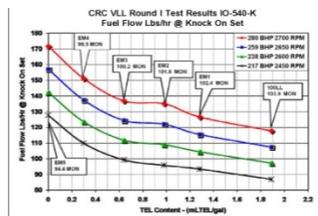

### INVESTIGATION OF REDUCED TEL CONTENT IN COMMERCIAL 100LL AVGAS

REPORT  
CRC PROJECT NO. CA-67-2010

## ASTM 100VLL Added to D910

The proposed ASTM method is under consideration with ASTM technical committee for an optional approval request to be made as a D910 addendum. The request is to revise or update or create a new ASTM standard for the use of 100VLL in the context of ASTM D910. The request is to revise or update or create a new ASTM standard for the use of 100VLL in the context of ASTM D910. The request is to revise or update or create a new ASTM standard for the use of 100VLL in the context of ASTM D910.

Designation: D910-07a  
An American National Standard  
Oct 11, 2010 Ballot to include provisions for Grade 100V130VLL (very low lead)

Standard Specification for Aviation Gasolines  
The reader is advised that the latest designation (D910) is under consideration. Following the designation solution the year of publication in the current version, the year of the revision or the year of the revision is shown in parentheses following the year of publication. A copyright notice is included at the end of each page. The standard is under consideration for approval by the American Society of Mechanical Engineers.

1. Scope
  - 1.1 This specification covers formulating specifications for purchases of aviation gasoline under contract and is intended primarily for use by purchasing agencies.
  - 1.2 This specification defines specific types of aviation gasoline for aviation use. It does not include all gasoline satisfactory for reciprocating aviation engines. Certain equipment or conditions of use may permit a wider, or require a narrower, range of characteristics than is shown by this specification.
2. Referenced Documents
  - 2.1 ASTM Standards:
    - D96 Test Method for Distillation of Petroleum Products of Atmospheric Pressure
    - D98 Test Method for Flash Point by Pensky-Martens Closed Cup Tester
    - D103 Test Method for Conversion to Copper-Based Detonation Product by Copper Strip Test
    - D107 Test Method for Vapor Pressure of Petroleum Products (Reid Method)
    - D121 Method of Test for Knock Characteristics of Motor Fuel at 100-Octane Number by the Motor Method<sup>1</sup>
    - D131 Test Method for Octane Content as Fuel by 2nd Engine
    - D132 Method of Test for Knock Characteristics of Motor Fuel by the Aviation Method<sup>2</sup>
    - D137 Test Method for Oxidation Stability of Aviation Fuels (Potential Sulfur Method)
    - D138 Test Method for Supercharge Rating of Spark Ignition Engines
    - D159 Test Method for Water Reaction of Aviation Fuels
    - D164 Test Method for Sulfur in Petroleum Products (Lamp Method)
    - D172 Test Method for Density, Relative Density (Density Gradient), or API Gravity of Crude Petroleum and Liquid Petroleum Products by Hydrometer Method
    - D176 Test Method for Freezing Point of Aviation Fuels
    - D178 Test Method for Color of Diesel Aviation Gasolines
    - D182 Test Method for Sulfur in Petroleum Products by Wavelength Dispersive X-ray Fluorescence Spectrometry
    - D183 Test Method for Electrical Conductivity of Aviation and Distillate Fuels
    - D170 Test Method for Motor Octane Number of Spark Ignition Engine Fuels
    - D1313 Test Method for Estimation of 2nd Heat of Combustion of Aviation Fuels

<sup>1</sup>This specification is under the jurisdiction of ASTM Committee D10 on Petroleum Products and Lubricants and is the direct responsibility of Subcommittee D10.01 on Aviation Gasolines. Current approved ASTM specifications are: D910, D910-07a, and D910-07a-01. For a complete list of all ASTM standards, visit the ASTM website, www.astm.org, or contact ASTM Customer Service at service@astm.org. For a complete list of ASTM standards, visit the ASTM website, www.astm.org, or contact ASTM Customer Service at service@astm.org. For a complete list of ASTM standards, visit the ASTM website, www.astm.org, or contact ASTM Customer Service at service@astm.org.

TABLE 1. Continued Specifications for Aviation Gasolines		100V130VLL	
Property	Units	Minimum	Maximum
Distillation (D96)	°C	100	100
Flash Point (D98)	°C	15	15
Vapor Pressure (D107)	mm Hg	2.5	2.5
Knock Characteristics (D121)	Octane Number	100	100
Water Reaction (D159)	mg/100 ml	0	0
Sulfur (D164)	ppm	0	0
Density (D172)	g/ml	0.72	0.72
Freezing Point (D176)	°C	-40	-40
Color (D178)	PCU	0	0
Sulfur (D182)	ppm	0	0
Electrical Conductivity (D183)	µmhos/cm	0	0
Motor Octane Number (D170)	MON	95	95
2nd Heat of Combustion (D1313)	kJ/kg	43.0	43.0

1. The standard for 100V130VLL is under consideration. The standard is under consideration for approval by the American Society of Mechanical Engineers. The standard is under consideration for approval by the American Society of Mechanical Engineers. The standard is under consideration for approval by the American Society of Mechanical Engineers.

Federal Aviation  
Administration

# FAA's Unleaded Avgas Transition Aviation Rulemaking Committee (UAT ARC)

- Charter signed by FAA Administrator 1/31/2011
- The UAT ARC was tasked with investigating the current issues relating to the transition to an unleaded fuel, and recommend the tasks necessary to investigate and resolve these issues
- The UAT ARC membership included FAA (Certification, Office Environment & Energy, & Tech Center) & EPA; manufacturers Lycoming, Continental, Cirrus, Cessna, etc; operator group AOPA, manufacturer group GAMA, EAA, fuel distributors and producer groups NATA, API, and fuel developers producers Exxon, GAMI, Shell, Swift

# 5 Key UAT ARC Issues Identified

- No Unleaded replacement fuel
- No program for fleet-wide introduction of replacement AVGAS
- No Market driven reason to introduce a replacement fuel
- No FAA policies or test procedures for fleet wide certification of a replacement unleaded fuel
- No standardized communication method to industry and end user

# UAT ARC Unleaded Avgas Transition Concept

# Implementation of UAT ARC 5 Key Recommendations & Accomplishments

# Replacement Fuels for General Aviation

## Why is PAFI program necessary?

- EPA may make an Endangerment Finding relative to lead in avgas in the late 2014-early 2015 timeframe
  - A positive endangerment finding will initiate regulatory activity by the EPA and the FAA to eliminate or reduce lead emissions from aircraft
- A safe, unleaded alternative to 100LL avgas is essential for the Continued Operational Safety of the GA fleet
- US legislation (Section 910 of the Reauthorization Act) requires the FAA continue research and development activities into the qualification of an unleaded aviation fuel and safe transition to this fuel for the fleet of piston engine aircraft
- FAA Business Plan-Destination 2025 performance metric for 2018
  - A replacement fuel for leaded aviation gasoline is available by 2018 that is usable by most general aviation aircraft

# Piston Aviation Fuels Initiative (PAFI)

- Mission: Facilitate the development and deployment of an unleaded AVGAS with the least impact on the existing piston-engine aircraft fleet. This is a govt/industry collaboration to ensure all stakeholders are involved in a coordinated approach to fleet wide implementation
- Established to develop a path forward for the identification, evaluation and fleetwide certification and deployment of the most promising unleaded replacement fuels
- Overcome the significant hurdles which have hindered past efforts to develop an unleaded avgas replacement
- Provides a sound process to ensure that this goal is achieved with a minimum of disruption to the general aviation industry and with the greatest likelihood of marketplace success
- The PAFI process involves a two phase testing program at the FAA's Technical Center

# What is the PAFI program?

## Purpose

- Supporting the Development of a Safe Unleaded Replacement Fuel for 100LL
  - Developing test methods and procedures to evaluate UL fuels
  - Conducting fuel property testing of candidate UL fuels
  - Conducting rig, component, engine and aircraft testing of candidate UL fuels
  - Preparing standardized test reports to support fuel specification development and certification of GA fleet to operate on UL fuels
- Develop data for ASTM production specification and fleetwide certification
- Benefits
  - Reduction and eventual elimination of harmful lead emissions
  - Safe operation of aircraft and engines on replacement UL fuel(s)

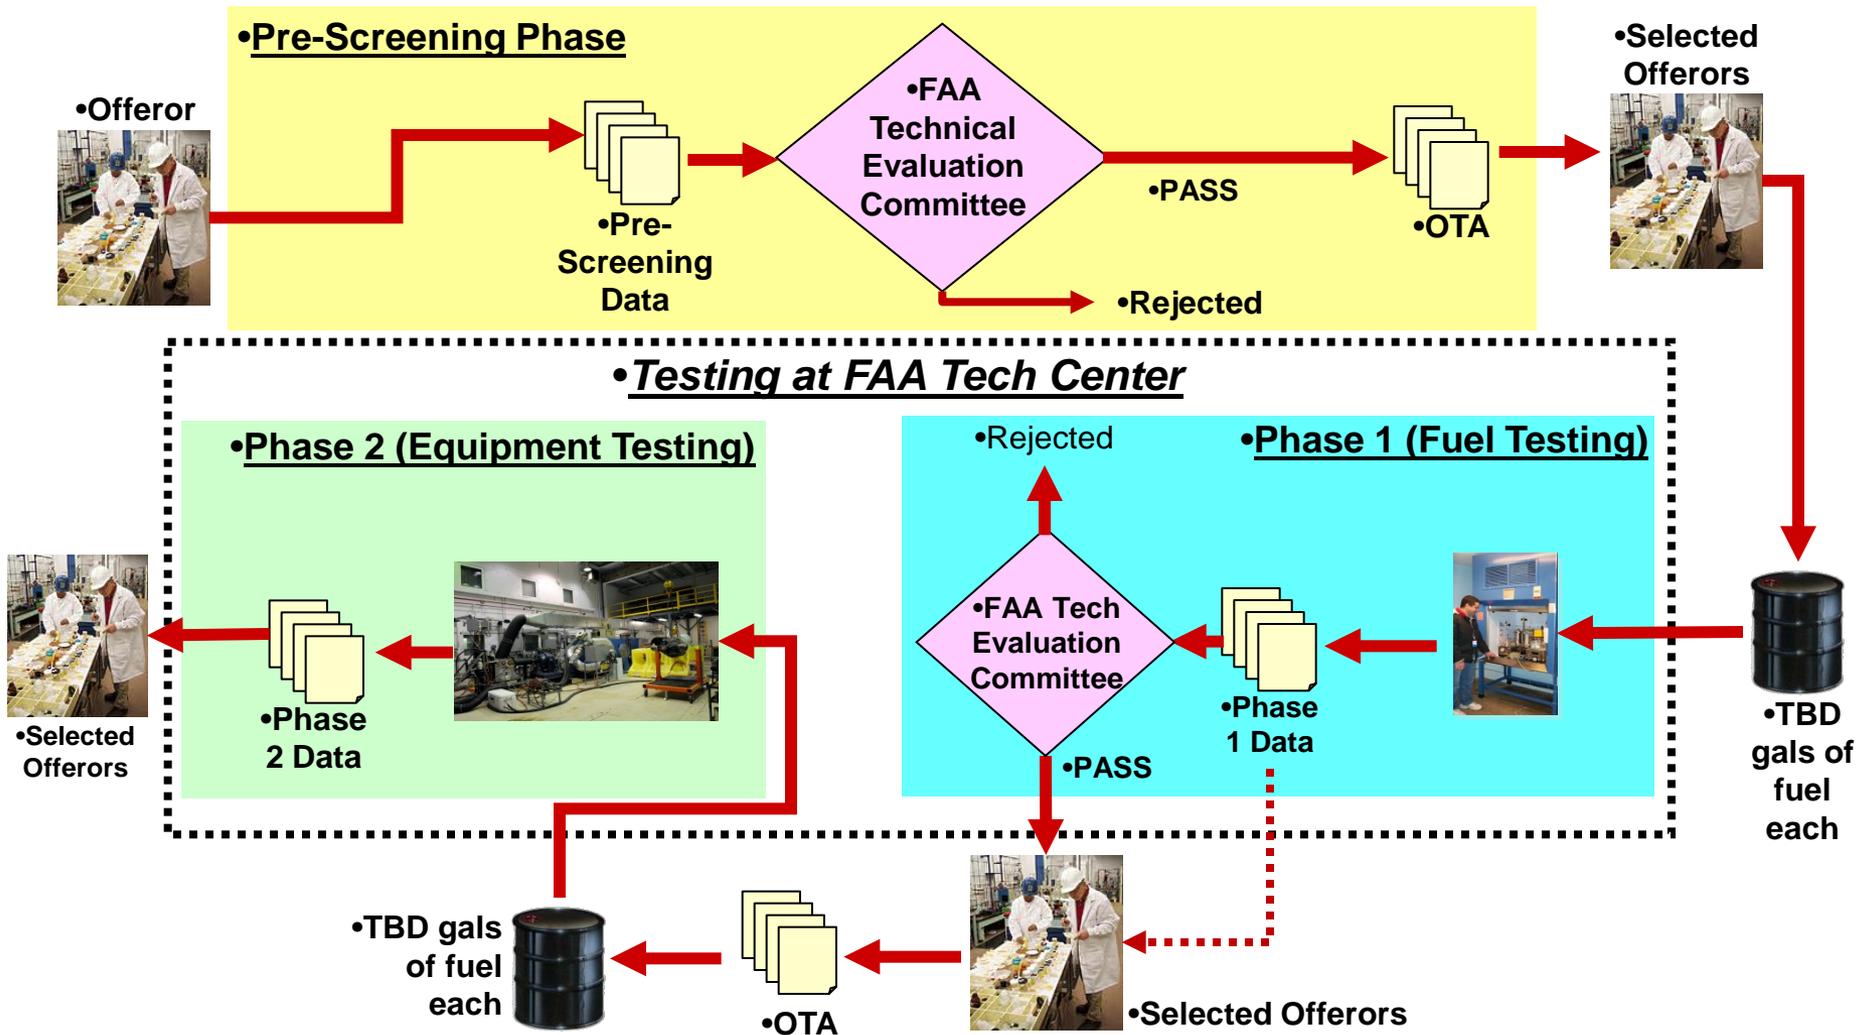

# PAFI Steering Group

- Purpose of the Piston Aviation Fuels Initiative Steering Group, (PSG):
  - To facilitate, coordinate, expedite promote and oversee PAFI based on the recommendations of the UAT ARC
- Members of PAFI PSG:
  - Aircraft Owners and Pilots Association (AOPA)
  - American Petroleum Industry (API)
  - Experimental Aircraft Association (EAA)
  - General Aviation Manufacturers Association (GAMA)
  - National Air Transportation Association (NATA)
  - National Business Aircraft Association (NBAA)
  - Federal Aviation Administration (AIR, AEE, Tech Center)

# FAA Request for Candidate Fuels

- Solicit Candidate Unleaded Fuels for FAA Testing
- Issued June 2013, Closes July 2014

# FAA Technical Center Testing Program

## Phase 1

Evaluates candidate fuels for potentially show stopping issues

- Chemical makeup
- Performance properties
- Establish credible and peer-reviewed test protocols for ascertaining necessary fit-for-purpose data
- Fit for purpose testing across the ranges allowed by the fuel formulations (worse case formulations)
- Evaluate emissions and toxicology properties
- Evaluate business case for candidate fuels
  - Projected production
  - Availability
  - Distribution
  - Costs

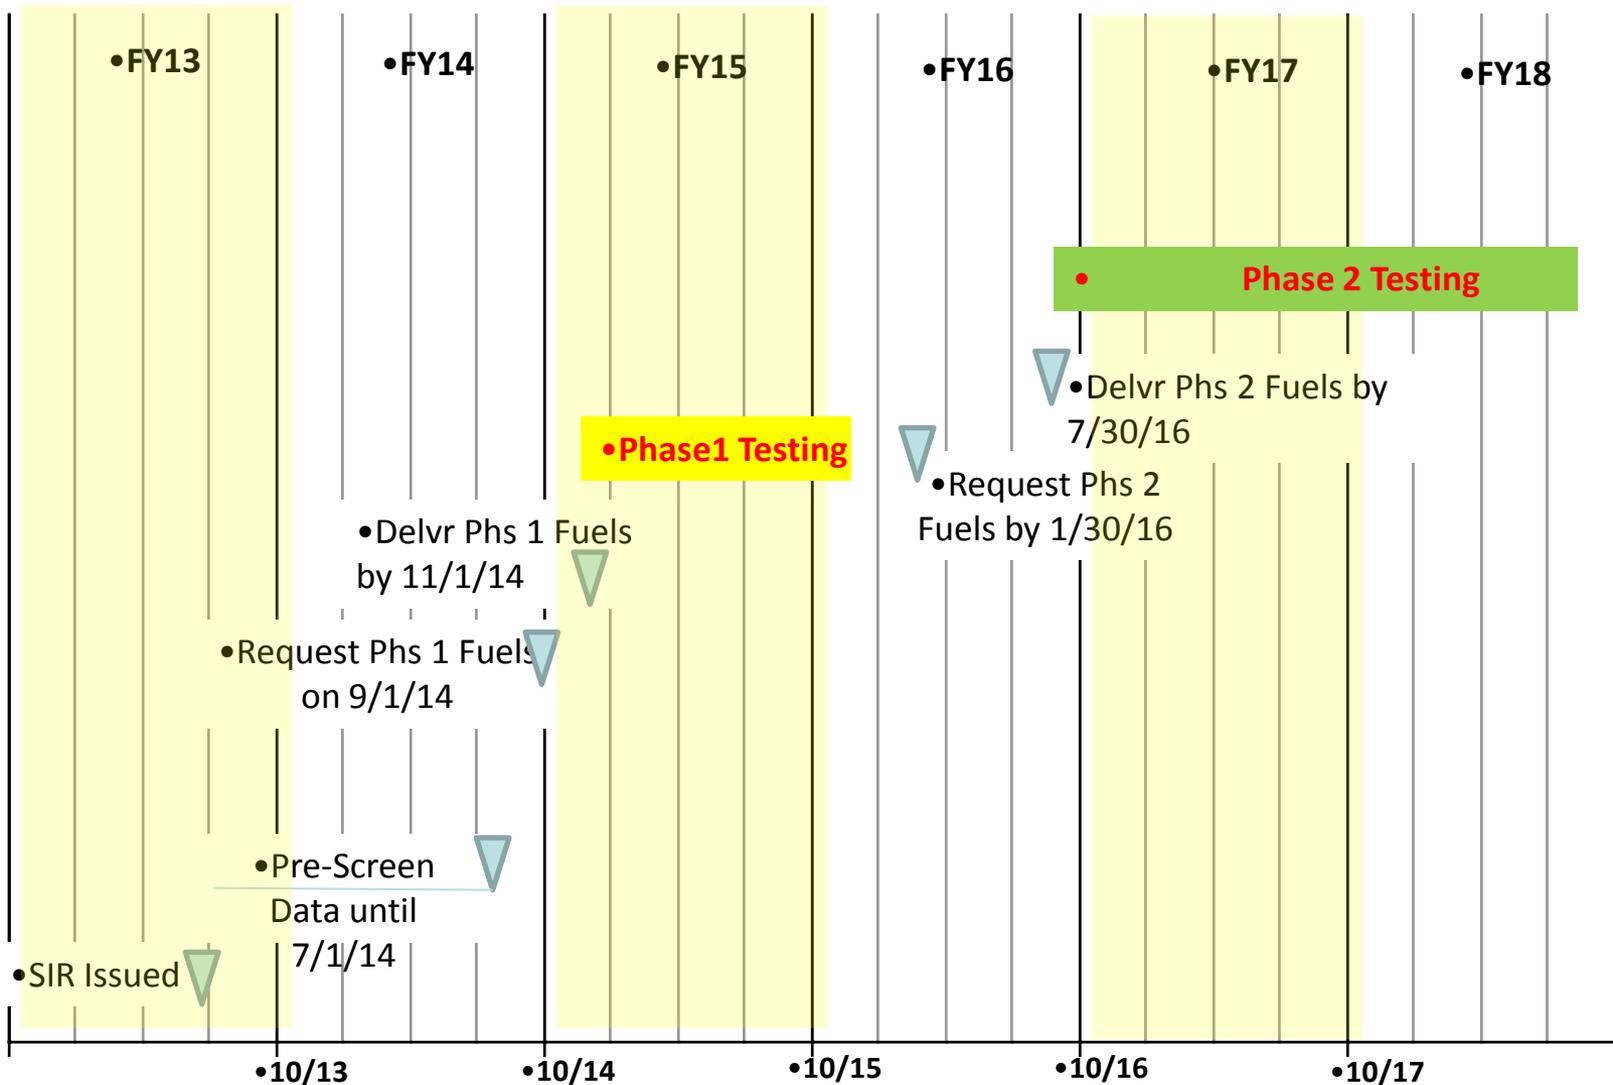

# FAA Technical Center Testing Program

## Phase 2

- Fuels to be tested at the engine and aircraft level to evaluate their suitability across as much of the existing fleet as possible
- Data collected from this testing will generate data that can be used to support the fleet wide approval of aircraft and engines including the orphaned fleet no longer supported by a manufacturer. This program is the most viable path to a fleet wide approval of new fuel formulations
- Data from the Phase 1 and Phase 2 testing can also be submitted for ASTM Production Specification, which will enable the fuels to be accepted in the marketplace in an orderly and comprehensive manner. FAA involvement in this step will ensure acceptance and adoption of the fuel with consumers and across the petroleum and aviation industry.

# •SIR Schedule

# Phase 2 Report

- The Phase 2 testing will result in reports containing data that can be utilized to obtain an ASTM production specification, and presented to the FAA for fleet wide certification
- Fleet wide Certification
  - Process will depend on the fuel – the closer the fuel is to current D910 fuel, the easier/simpler this effort can be

# Canada and US Collaboration

- TCCA and the FAA continue to have discussions on the fuel program to help solve this global issue
- The FAA obtained \$6M for funding this year for centralized testing in the US
- Canada & US wishes to collaborate on the identification and certification of unleaded fuels
- We will work together to identify the most effective portions of the program for Canadian participation
- The solution will mutually help Canada's 30,000 and the US 167,000 general aviation aircraft

# Fleet wide Certification

- Form of Approval
  - Portion of fleet may be “drop-in” or transparent
    - Could issue a type of approval/statement of equivalency (not sure what type but in-work)
  - Portion of fleet may require design change
    - More complicated... (ATC, STC, option for modification of method above with contingencies??)
    - Non-traditional methods will require extensive coordination to ensure all requirements/needs are met
  - FAA is committed to develop a fleet wide approval methodology to align with PAFI schedule

# Questions?
